Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Original) A method for separating substances characterized by chromatographically

separating said substances with the use of a packing which contains a charged (co)polymer and

makes it possible to change the effective charge density on the surface of a stationary phase by a

physical stimulus while fixing a mobile phase to an aqueous system.

2. (Original) The separation method as claimed in Claim 1, wherein said physical

stimulus is a change in temperature.

3. (Original) The separation method as claimed in Claim 2, wherein said packing is a

chromatographic packing chemically modified on the surface of a carrier with a temperature-

responsive polymer.

4. (Currently Amended) The separation method as claimed in Claim 3, wherein said

packing is a chromatographic packing chemically modified with a temperature-responsive

polymer by using the a radical polymerization method.

5. (Currently Amended) The separation method as claimed in Claim 3 wherein said

temperature-responsive polymer, with which the surface of the carrier is chemically modified, is

a polyalkylacrylamide polymer or copolymer having an amino group, a carboxyl group, or a

hydroxyl group in the side chains or at the ends.

Applicant: Teruo Okano, et al.

6. (Original) The separation method as claimed in Claim 5, wherein said polyalkylacrylamide is one selected from among poly(N-isopropylacrylamide), poly(N-propylacrylamide), polydiethylacrylamide and polyacryloylpyrrolidine.

- 7. (Currently Amended) The separation method as claimed in **any of** Claim 1, wherein said substances are those selected from among metal elements, drugs and biological components.
- 8. (Currently Amended) A method for separating substances characterized by retaining the substances in a stationary phase made of a chromatographic packing chemically modified with a polyalkylacrylamide copolymer having an amino **group**, a carboxyl **group**, or a hydroxyl group, then changing the hydrophilic/hydrophobic balance on the surface of the stationary phase by **the a** temperature gradient method wherein **the an** external temperature is changed stepwise, and passing the substances through a single mobile phase to thereby separate the same.
- 9. (Original) The separation method as claimed in Claim 8, wherein said mobile phase is an aqueous solvent.
- 10. (Previously Presented) The separation method as claimed in Claim 8, wherein said polyalkylacrylamide is one selected from among poly(N-isopropylacrylamide), poly(N-propylacrylamide), polydiethylacrylamide and polyacryloylpyrrolidine.
- 11. (Currently Amended) The separation method as claimed in any of Claim 8, wherein said substances are those selected from among metal elements, drugs and biological components.

12-14. (Withdrawn)

15-19. (Not Entered)

Applicant: Teruo Okano, et al.

20. (New) The separation method as claimed in Claim 8, wherein the polyalkylacrylamide copolymer has a plurality of amino groups, a plurality of carboxyl groups, or a plurality of hydroxyl groups.

- 21. (New) A method for separating substances characterized by chromatographically separating said substances with the use of a packing which contains a charged (co)polymer and makes it possible to change the effective charge density on the surface of a stationary phase by a change in temperature while fixing a mobile phase to an aqueous system, wherein said packing is a chromatographic packing chemically modified on the surface of a carrier with a temperature-responsive polymer, with which the surface of the carrier is chemically modified, is a polyalkylacrylamide polymer or copolymer having a plurality of amino groups, a plurality of carboxyl groups, or a plurality of hydroxyl groups in the side chains or at the ends.
- 22. (New) The separation method as claimed in Claim 21, wherein said packing is a chromatographic packing chemically modified with a temperature-responsive polymer by using a radical polymerization method.
- 23. (New) The separation method as claimed in Claim 21, wherein said polyalkylacrylamide is one selected from among poly(N-isopropylacrylamide), poly(N-propylacrylamide), polydiethylacrylamide and polyacryloylpyrrolidine.
- 24. (New) The separation method as claimed in Claim 21, wherein said substances are those selected from among metal elements, drugs and biological components.
